- 6. Calibration

DESCRIPTION

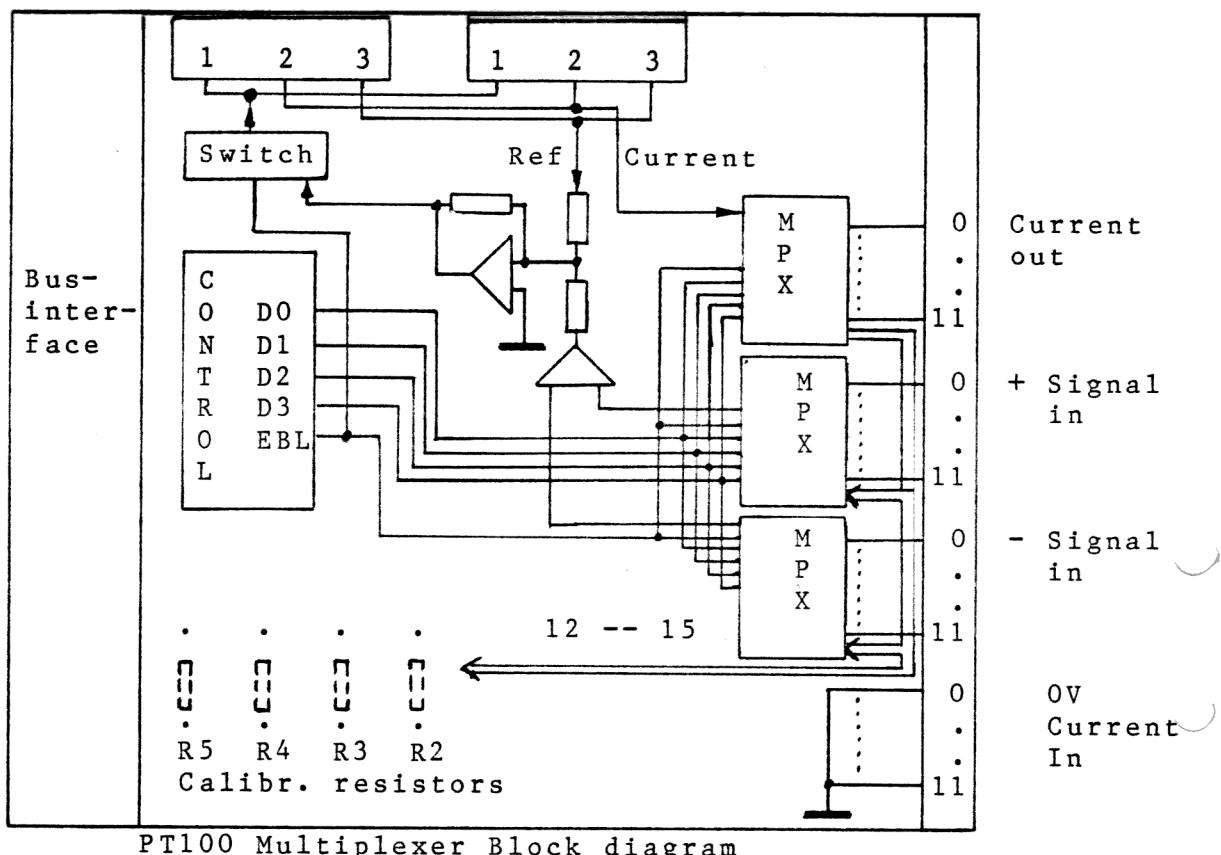

- The PT100 multiplexor card can be connected to 12 PT100 transducers.
- Several MPX cards can be connected in parallel to the converter card.
- The current is multiplexed out to the transducers for measurement.
- The voltage signal is amplified on the MPX card and biased, by subtracting a part of the reference voltage, before sending the signal to the conversion card. The bias transforms the temperature range to be -50 degrees - +150 degrees Celsius. The resolution is 1/4096 of the full measuring range. As standard ca +-0.05 degrees Celsius is achieved.
- Selection of measuring range is done with an exchangable module on the MPX card.
- Modules for other measurement ranges can also be delivered.
- To simplify calibration, the card includes four positions for calibration resistors. These on-board resistors are addressed as channel 12 - 15 and are marked R2 ... R5 on the card.

BESKRIVNING

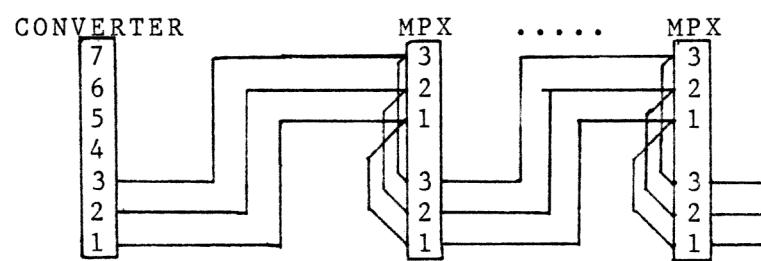

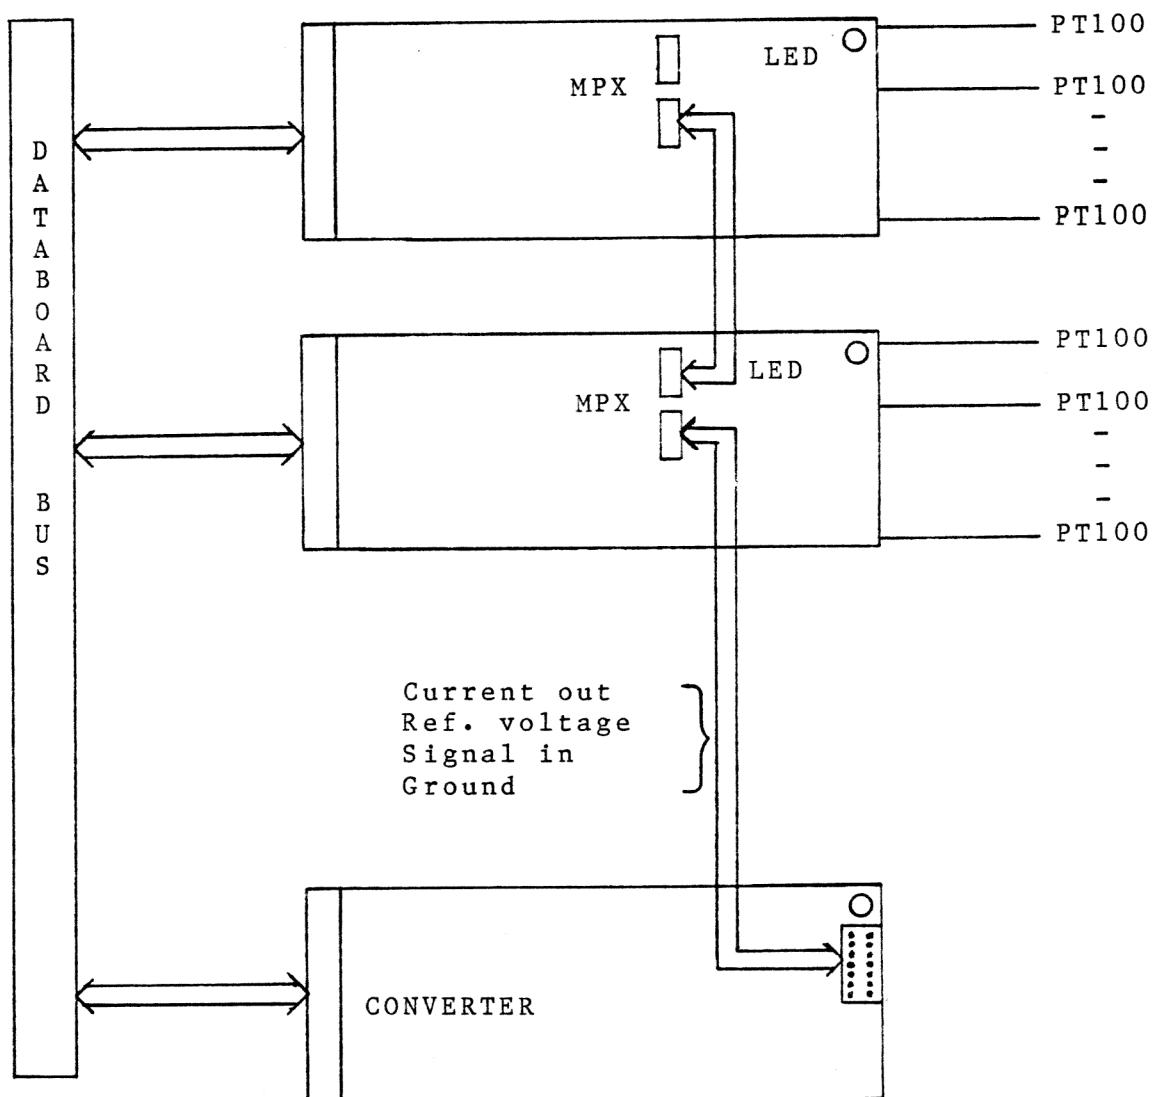

- Till PT100 multiplexerkortet kan anslutas 12 st. PT100-givare.
- Flera MPX kort kan anslutas parallellt till omvandlarkortet.
- Strömmen till givarna multiplexas vid tidpunkten för mätning.
- Signalen från givarna förstärks på MPX-kortet, varvid mätområdet begränsas åt den kalla sidan genom att en del av referensen dras ifrån innan mätsignalen går vidare till omvandlarkortet. Därvid blir temperaturområdet -50 grader .. +150 grader C. Upplösningen blir därmed 1/4096 av fullt mätområde. Som standard erhålls ca +- 0.05 grader Celsius.
- Val av mätområde sker via en utbytbar modul på multiplexerkortet.
- Moduler för andra mätområden kan även levereras.
- För att kunna kalibrera systemet med programvara, finns fyra platser på kortet för kalibreringsmotstånd. Dessa kalibreringsmotstånd ligger på kanal 12 - 15 och är märkta R2 ... R5.

PT100 Multiplexer Block diagram

TECHNICAL DATA
TEKNISKA DATA

Power supply:	+5V/+-5%
Spänningssmatning:	+12V/+-5% or +15V/+-5% -12V/+-5% or -15V/+-5%
Bus connection:	I/O side. B 64 pin Euroconnector
Buss anslutning:	DIN 41612
I/O connector:	To transducers: DIN 41612 Euroconnector
I/O kontakt:	To the converter: 6-pin connector To other MPX.: 6-pin connector
Measuring range:	Depending on the selected module.
Mätområde:	Standard gives -50 ... +150 degr.Cels. Beroende på vald modul.
Resolution:	1/4096 of the full range.
Upplösning:	Depending on the selected range module. Standard gives +-0.05 degrees Celsius.
Calibration positions:	Four positions for calibration
Kalibreringsmotstånd:	resistors are available on the card. Plats för fyra kalibreringsmotstånd finns på kortet.
Connection:	Several MPX can be connected in parallel.
Inkoppling:	Flera MPX-kort kan kopplas parallellt.

=====
MEASURING SYSTEM CONFIGURATION

COMMANDS

KOMMANDON

- Card select is done with the CS strobe.
- The MPX address is output with the OUT strobe together with the enable command for the MPX card.
- OBS! Disable other MPX cards before a new card is enabled! OUT 0,0 gives disable.
- Select the converter card.
- Preset the counters.
- Wait for the signal to stabilize.
- Read in the results with the STAT and INP strobes.
- Kortval görs med CS-stroben.
- Med OUT stroben lägges MPX-adressen ut samtidigt som multiplexerkortet enablas.
- OBS! Disabla andra MPX kort innan ett nytt MPX enablas!
- Disable kommandot är OUT 0,0.
- Välj in omvandlarkortet.
- Förinställ räknaren.
- Vänta tills signalen stabiliseras.
- Läs in resultatet med STAT och INP strobarna.

CS Card select.
 Assemb. OUT 1
 Fortran OUTPUT(1)=A
 Basic OUT 1,A
 Pascal OUT(1,A)

OUT Set multiplexer address and enable switches
 Assemb. OUT 0 D0
 Fortran OUTPUT(0)=B D1 MPX address (0 - 11)
 Basic OUT 0,B D2 (or 12-15 for calibr.)
 Pascal OUT(0,B) D3
 D4 Enable MPX (Current to transd.,
 D5 Not used Connect signal to
 D6 Not used converter card,
 D7 Not used active 1)

EX. OUT 0,0 gives disable of the selected MPX card.

Ex. OUT 0,23 , Select MPX 7 and enable the MPX card

CALIBRATION

KALIBRERING

- The calibration to achieve the resistance from the measured voltage, is done using at least two calibration resistors, normally mounted on the MPX board.
- The voltage across these resistors are read from the MPX-channels 12 - 15 regularly with the user program and the calibration-constants are recalculated.
- Kalibrering av resistans via uppmätt spänning görs med minst två kalibreringsresistanser, lämpligen monterade på MPX kortet.
- Spänningen över dessa resistanser läses från MPX-kanalerna 12 - 15 regelbundet med användarprogrammet, varvid kaliberingskonstanterna beräknas.

$$\text{Formula: } R_x = K * U_x + L$$

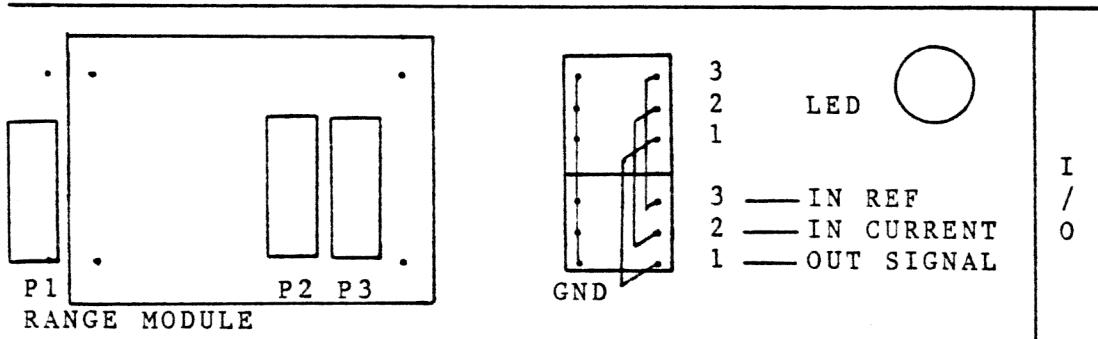

Using two calibration resistors R_1 and $R_2 \Rightarrow$

$$K = (R_2 - R_1) / (U_2 - U_1)$$

$$L = ((U_2 * R_1) - (U_1 * R_2)) / (U_2 - U_1)$$

COMPONENT POSITIONS

KOMPONENTPLACERING

The potentiometers P1, P2, P3 are preset at delivery, and should not need adjusting.

P1 : DC - offset

P2, P3 : Sensitivity and zero level. P2 controls the gain for the REF signal and P3 controls the input signal gain.
